

Modular software tailored for your mission

ABOUT ORYX

Oryx OBCS is a **modular flight software** tool developed for the mission control of small satellites. It manages all satellite tasks – namely, **processing telecommands sent by the operators, monitoring the power budget, executing pre-defined schedules, managing emergencies and handling data from all the sensors on board.**

Oryx utilises an innovative framework that facilitates the customised development of your own mission. Thanks to its **modular architecture**, based on building blocks, it supports the rapid development of the mission's software by using a vast **library of components - logging, scheduling, testing and communication** to name but a few.

The ease at which a testing environment and software simulator can be set up ensures in-depth evaluation of your applied solutions from the onset of the project. Should your component not be supported by Oryx, you can simply **extend your simulation by creating customised drivers.**

Our on-board **software exposes an API** that can be accessed by the small Lua scripts, providing access to selected sensors and peripherals, which is definitely a game changer!

ORYX CAPABILITIES:

Satellite management

Telemetry, tracking and command handling

Fault detection

Isolation and recovery support

Task scheduling

Flexible task management based on the time, position and platform status

Data storage

Managing up to 4 GB file-based storage with a short boot time

Communication

Access to the satellite through secure data links

Extensibility

Using scripting language to manage in-flight issues and extend the OBC features after the launch

Testability

Faster satellite integration thanks to the built-in algorithm, software and hardware-in-the-loop tests

ORYX IS BUILT OUT OF 3 KEY ELEMENTS:

- ◆ **The Software Development Kit (SDK)** – a set of libraries written in C++ containing crucial on-board services for telemetry and telecommand, a hardware abstraction layer and a library of drivers for popular systems.
- ◆ **Development Tools** – systems simulators and a suite of automated tests which enable comprehensive testing of the flight software either by running locally on the PC (using QEmu) or by connecting to the hardware engineering model (using the Oasis EGSE board).
- ◆ **Oasis EGSE** – a single-board, CubeSat PC-104 compatible EGSE that serves as an interface between the PC-running simulators and the hardware engineering model. Enables the running of integration tests which use actual hardware connections between satellite components (I2C, CAN, UART, SPI).

THE MOST IMPORTANT ELEMENTS OF ORYX SDK ARE:

- ◆ **Scheduler** – used to run scheduled and automated jobs that can be time-triggered or initiated by any other telemetry values. Furthermore, it is extensible with the Scripting Engine.
- ◆ **The Scripting Engine** – a Lua-based service which enables the running of precompiled Lua scripts on board. All internal APIs are exposed to the Lua module to give the possibility of evolving the mission objective and automated jobs without the necessity of reuploading the entire flight software.
- ◆ **COMM Protocols** – a set of libraries implementing CCSDS-compatible communication channels for telecommands and telemetry with built-in security.
- ◆ **The Drivers Library** – a set of pre-existing drivers for popular nano- and small-satellite systems.

TECHNICAL SPECIFICATION

MEMORY	<ul style="list-style-type: none">◆ Min. 1 MB (code) (depending on the selected features)◆ Min. 1 MB (data) (depending on the selected features)
SUPPORTED MCUs	<ul style="list-style-type: none">◆ ARM Cortex-M, ARM Cortex-R
RECOMMENDED MINIMUM CLOCK	<ul style="list-style-type: none">◆ 50 MHz
STORAGE	<ul style="list-style-type: none">◆ Data storage: NAND flash memory up to 4 GB◆ High reliability FRAM-based storage
DEVELOPMENT TOOLS	<ul style="list-style-type: none">◆ Open-source, cross-platform tools: CMake, GCC, Python◆ Modern technologies: C++17
SUPPORTED OFF-THE-SHELF SUBSYSTEMS	<ul style="list-style-type: none">◆ Kryten M3 by AAC Clyde Space◆ EPS (STARBUCK) + Batteries by AAC Clyde Space◆ ADCS by AAC Clyde Space◆ VHF/UHF Transceiver by CPUT◆ Leopard DPU by KP Labs◆ UVTRX by ISIS◆ IMTQ by ISIS◆ ANT module by ISIS◆ uCam II camera module by 4D Systems◆ Q20 HD GPS by QinetiQ and all NMEA-based receivers◆ EWC27-SRX X/S Transceiver by Syrlinks◆ Easy to add support for any subsystem using I2C, UART, CAN, SPI
GROUND SEGMENT COMMUNICATION	<ul style="list-style-type: none">◆ AX.25 based modules◆ S/X stream-based modules (CCSDS compliant)◆ Flexible communication stack◆ Optional: encryption, authentication
GROUND SOFTWARE SUPPORT	<ul style="list-style-type: none">◆ XTCE and SEDS-compliant spacecraft database◆ YAMCS integration◆ Easy integration with any MCS during the whole process (from the mission development to in-orbit operations)

Oasis is an EGSE used by Oryx to interface between an OBC hardware and the satellite systems simulators running on a PC.

CASE STUDY

Oryx will be the heart of the Intuition-1 mission, which is planned for launch in 2022. Intuition-1 is a 6U-class satellite with a data processing unit enabling on-board data processing acquired via a hyperspectral instrument with spectral resolution in the range of visible and near infrared light.

ABOUT US

KP Labs is a NewSpace company based in Poland. We support deep space exploration with enhanced spacecraft autonomy technologies including hyperspectral imaging instruments and high-efficiency Data Processing Units. Our company consists of a team of 40 engineers who do not think that the sky is the limit.
